Overview

The USB-2408 Series are multifunction DAQ devices designed for highly-accurate voltage or temperature measurements. Each device features up to 16 single-ended (SE)/8 differential (DIFF) analog inputs. Each device includes 8 digital I/O and two counter inputs. The USB-2408-2AO also features two analog outputs. Each device in the series offers 24-bit resolution for ultra-accurate voltage or TC measurements.

Analog Input

Each device includes 16 SE/8 DIFF analog inputs which you can configure for voltage or TC input on a per-channel basis. Eight software-selectable voltage input ranges are provided. You can configure these ranges on a per-channel basis from ± 10 V to ± 0.078 V. When measuring TCs, configure analog inputs in DIFF mode. All devices also include open TC detection to identify improperly working thermocouples.

Sample Rate

USB-2408 Series devices can sample analog input channels at up to a 1 kS/s.*

Digital I/O

Eight digital I/O channels are included with each USB-2408 Series device, and you can read from or write to each individual bit.

Counters

Two 32-bit counters are included with USB-2408 Series devices. The TTL level inputs are capable of read/write rates of up to 500 Hz and an input frequency of up to 1 MHz.

Analog Output (USB-2408-2AO only)

The USB-2408-2AO includes two 16-bit analog outputs. Each output has a ± 10 V range. Both outputs can be updated at a rate of up to 500 S/s per channel; one output can be updated at a rate of 1 kS/s.

Software

Each USB-2408 Series device includes TracerDAQ, an out-of-the-box application that generates, acquires, analyzes, displays, and exports data within seconds of installing data acquisition hardware. TracerDAQ includes a Strip Chart, Oscilloscope, Function Generator and Rate Generator, all of which are accessed through a common, easy-to-use menu page.

Driver support and detailed example programs are included for Universal Library programming libraries for Microsoft® Visual Studio® programming languages, and other languages, including DASyLab®, and ULx for NI LabVIEW®.

General Information & Specifications

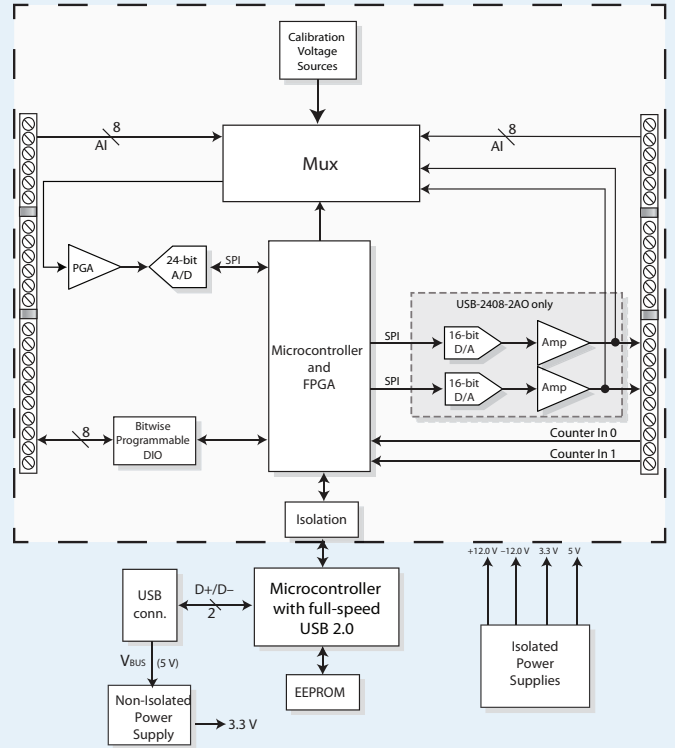

DAQFlex

For DAQ programming in virtually any OS, USB-2408 Series devices include DAQFlex, a framework that combines a small footprint driver with a message-based command protocol. The simplicity of the driver is enabled with a message-based protocol that offers an efficient yet powerful interface to DAQ devices and a common command set that simplifies application development.

FlexTest is an interactive GUI-based utility that demonstrates how to communicate with a device using the DAQFlex communication protocol and software.

* Each terminal block has a CJC sensor. The accuracy listed above assumes the screw terminals are at the same temperature as the CJC sensor. The accuracy errors do not include the inherent accuracy error of the TC sensor. Ask your TC supplier about the actual TC sensor accuracy limitations. Connect TCs to the USB-2408 Series device so that they float with respect to AGND. When configuring TC sensors, keep any stray capacitance relative to AGND as small as possible to avoid settling time and accuracy errors.

AGND and DGND pins are isolated from earth ground. To connect TC sensors to voltages referenced to earth ground, maintain isolation between the AGND/DGND pins and earth ground. To achieve the TC accuracies listed above, warm up the USB-2408 Series device for 45 minutes after the initial power on. The accuracies listed above are only guaranteed if the device is housed in the plastic enclosure.
